What was the Total Revenue for Energy companies in Year 1

This is a Histogram for all energy companies in year 1. The histogram is right skewed or positively skewed, which means that the mean is higher than the median.

The mean for all energy companies in year 1 is \$31,071,783,206.61 which is almost triple the value of the median \$11,325,000,000. Total revenue of \$1-100 billion, was the most frequent value of 27 Energy companies.

The Standard Deviation of total revenue is 61,672,724,810.11, which is very high. That means the values are spread out. With a range of \$450,327,296,000, the skewness can be explained by the presence of 1 Energy company that has a total revenue of more than \$400 Billion in year 1.
